

Imaging Cardiovascular Macro- and Microstructure

Using HfO₂ Nanocrystals as X-ray Tomography Contrast Agents

Principle investigators: Prof. Dr. Jonathan De Roo and Dr. Anne Bonnin

In DeRooLab (Department of Chemistry, University of Basel), we are working on the synthesis and analysis of nanocrystals and atomically precise clusters.^[1-3] In the X-ray Tomography Group (Swiss Light Source, Paul Scherrer Institut), we are developing instrumentations and algorithms for tomographic X-ray imaging, exploiting synchrotron and laboratory sources.^[4-5]

In 2016, cardiovascular diseases were responsible for 31% of all global deaths (WHO). To develop personalized treatment, it is essential to analyse the structural organization of the heart. Synchrotron Radiation X-ray Phase Contrast Imaging (SR X-PCI) is a non-destructive tomography technique, providing 3D information: from full heart morphology down to cellular level microstructure. However, the use of a contrast agent remains necessary to achieve ultra-fast acquisition or improve contrast for cell differentiation.

Your tasks

In your first years, you will learn synthetic inorganic techniques at the University of Basel and develop sustainable syntheses for hafnium oxide nanocrystals and hafnium oxo-clusters. You will then learn how to functionalize the surface to stabilize the particles in biologically relevant media. Finally, you will apply these CT (computed tomography) contrast agents at the Paul Scherrer Institute to visualize the cardiovascular system of the whole heart and improve the contrast in heart transplant biopsies. This experience will offer you a broad range of synthetic and analytical techniques, including electron microscopy, nuclear magnetic resonance, X-ray diffraction, X-ray tomography, etc.

Your profile

You are highly motivated and have a Master in Nanosciences or Chemistry. A highly interdisciplinary background is a plus, in the areas of synthetic chemistry, physical chemistry and physics. Computing and image analysis skills would be an asset. You enjoy working in a dynamic, multidisciplinary and multicultural team.

You will be registered as a PhD student in the graduate program of the Swiss Nanoscience Institute at the University of Basel.

Please submit your application through the dedicated online application system [Project P2001]
